abstract goes here

Introduction

Method

Rmarkdown also lets us track figure labels, and updates them automatically. Look! Kittens! Illustrated in Figure **??**. And if I add other figures it will sort out the numbering and references automatically

Results

Now let's integrate some R code to generate/import some data, run and analyse and integrate it into the document:

You can't see it in the PDF, but in between this paragraph and the last we asked R to generate some random data and save it to a CSV file. Now we're going to import the data from the CSV file, as if it was independently created data - from an experiment or similar - and plot a graph.

Figure 1. Histogram of all data, grouped

See Figure 1. Of course we could draw all sorts of things, but this is a proof-of-concept. Finally, let's run a t-test and integrate the results into the text.

We found there was a statistically significant difference between the two groups (t=-6.79 (587.58), p = 0.00). Note how the exact values in the previous sentence change every time we re-make the document (because the document also regenerates the underlying data).

The above paragraph does the integration of statistics longform, because I didn't know a better way (and because I think it is still useful to show). apa_print() exists as a helper function: http://frederikaust.com/papaja_man/reporting.html.

Also, everyone loves tables. See Table 1. I feel obliged to mention that the actual items reported in this table **do not** correctly reflect the actual subscales for the ASRS short and long scales. Note illustration of **bold** and *italics* formatting in this para.

TOM STAFFORD[1], JUNYAN ZHU[2], & KATHARINE DOMMETT[2]

Table 1
Item grouping to subscales

	Hyperactivity	Inattention
ASRS-18	5,6,12,13,14	1,2,3,4,7,8
ASRS-6	5,6	1,2,3,4

Note. This table was created with apa_table().
